ZendHQ

Advanced PHP Application Observability and Orchestration Tooling

ZendHQ makes PHP application observability and orchestration easy. With ZendHQ, you can monitor your production applications, get detailed code traces when errors occur, do live introspection of applications, and configure and enable deferred job execution for your applications.

Instantaneous Observability

Boosting performance with powerful monitoring and debugging tools, ZendPHP is a proven platform that helps organizations increase application performance, reduce downtime, and improve agility.

HIGHLY CONFIGURABLE MONITORING

Configure rules for monitoring sensitive function calls, memory usage, CPU usage, and more – all with configurable severity thresholds and the ability to capture code traces and trigger webhooks based on configured events.

LIVE INTROSPECTION WITH Z-RAY

With Z-Ray, you can immediately understand the impact of any code changes you are making, so you can improve quality and solve issues faster during testing phases — and after code is in production.

Inherently Secure Architecture

ZendHQ is designed to be secure by default, and is best deployed on a private network to ensure your data – even if it's received from public-facing applications – is never publicly exposed.

Scale Your Application In Minutes

Modern PHP applications often have processes that can and should be run in the background – without requiring a customer to wait for a response. ZendHQ makes it easy to schedule, defer, and manage these processes.

JOB DEFERMENT AND SCHEDULING

ZendHQ JobQueue makes it easy to defer long-running processes so your users can get a response as soon as possible – and schedule resource-heavy jobs to happen outside of high-volume hours.

RECURRING JOBS

With ZendHQ JobQueue, you can schedule work to occur on regular cadences – making mundane jobs easy and repeatable.

JOB QUEUE MANAGEMENT

The ZendHQ GUI makes it easy to schedule, configure, and manage your job queues.

Decreased IT Complexity and Overhead

ZendHQ simplifies the IT infrastructure needed to support effective orchestration and observability – meaning you can use one secure tool instead of half a dozen.
